

Submission Requirements

1. PROGRAM CODE (CREATED INDEPENDENTLY OR COLLABORATIVELY)

Submit one PDF file that contains all of your program code (including comments). Include comments or acknowledgments for any part of the submitted program code that has been written by someone other than you and/or your collaborative partner(s).

IMPORTANT:

If the programming environment allows you to include comments, this is the preferred way to acknowledge and give credit to another author. However, if the programming environment does not allow you to include comments, you can add them in a document editor when you capture your program code for submission.

In your program, you must include student-developed program code that contains the following:

- ☐ Instructions for input from one of the following:
 - ◆ the user (including user actions that trigger events)
 - ◆ a device
 - ◆ an online data stream
 - ◆ a file
- ☐ Use of at least one **list** (or other **collection type**) to represent a collection of data that is stored and used to manage program complexity and help fulfill the program's purpose

IMPORTANT:

The data abstraction must make the program easier to develop (alternatives would be more complex) or easier to maintain (future changes to the size of the list would otherwise require significant modifications to the program code).

- ☐ At least one procedure that contributes to the program's intended purpose, where you have defined:
 - ◆ the procedure's name
 - ◆ the return type (if necessary)
 - ◆ one or more parameters

IMPORTANT:

Implementation of built-in or existing procedures or language structures, such as event handlers or main methods, are not considered student-developed.

- ☐ An algorithm that includes sequencing, selection, and iteration that is in the body of the selected procedure
- ☐ Calls to your student-developed procedure
- ☐ Instructions for output (tactile, audible, visual, or textual) based on input and program functionality

DEFINITION:

List

A **list** is an ordered sequence of elements. The use of lists allows multiple related items to be represented using a single variable. Lists may be referred to by different names, such as **arrays**, depending on the programming language.

DEFINITION:

Collection Type

A **collection type** is a type that aggregates elements in a single structure. Some examples include lists, databases, and sets.

IMPORTANT:

With text-based program code, you can use the print command to save your program code as a PDF file, or you can copy and paste your code to a text document and then convert it into a PDF file.

With block-based program code, you can create screen captures that include only your program code, paste these images into a document, and then convert that document to a PDF. Screen captures should not be blurry, and text should be at least 10 pt font size.

2. VIDEO (CREATED INDEPENDENTLY)

Submit one video file that demonstrates the running of your program as described below. Collaboration is **not** allowed during the development of your video.

Your video must demonstrate your program running, including:

- ☐ Input to your program
- ☐ At least one aspect of the functionality of your program
- ☐ Output produced by your program

Your video may NOT contain:

- ☐ Any distinguishing information about yourself
- ☐ Voice narration (though text captions are encouraged)

Your video must be:

- ☐ Either .mp4, .wmv, .avi, or .mov format
- ☐ No more than 1 minute in length
- ☐ No more than 30MB in file size

3. WRITTEN RESPONSES (CREATED INDEPENDENTLY)

Submit your responses to prompts 3a – 3d, which are described below. Your response to all prompts combined must not exceed 750 words (program code is not included in the word count). Collaboration is **not** allowed on the written responses. Instructions for submitting your written responses are available on the [AP Computer Science Principles Exam Page](#) on AP Central.

3 a. Provide a written response that does all three of the following:

Approx. 150 words (for all subparts of 3a combined)

- i. Describes the overall purpose of the program

- ii. Describes what functionality of the program is demonstrated in the video

- iii. Describes the input and output of the program demonstrated in the video

- 3b.** Capture and paste two program code segments you developed during the administration of this task that contain a list (or other collection type) being used to manage complexity in your program.

Approx. 200 words (for all subparts of 3b combined, exclusive of program code)

- i. The first program code segment must show how data have been stored in the list.

- ii. The second program code segment must show the data in the same list being used, such as creating new data from the existing data or accessing multiple elements in the list, as part of fulfilling the program's purpose.

Then, provide a written response that does all three of the following:

- iii. Identifies the name of the list being used in this response

- iv. Describes what the data contained in the list represent in your program

- v. Explains how the selected list manages complexity in your program code by explaining why your program code could not be written, or how it would be written differently, if you did not use the list

DEFINITION:

List

A **list** is an ordered sequence of elements. The use of lists allows multiple related items to be represented using a single variable. Lists may be referred to by different names, such as **arrays**, depending on the programming language.

DEFINITION:

Collection Type

A **collection type** is a type that aggregates elements in a single structure. Some examples include lists, databases, hash tables, dictionaries, and sets.

IMPORTANT:

The data abstraction must make the program easier to develop (alternatives would be more complex) or easier to maintain (future changes to the size of the list would otherwise require significant modifications to the program code).

- 3 c.** Capture and paste two program code segments you developed during the administration of this task that contain a student-developed procedure that implements an algorithm used in your program and a call to that procedure.

Approx. 200 words (for all subparts of 3c combined, exclusive of program code)

- i. The first program code segment must be a student-developed procedure that:
- ☐ Defines the procedure's name and return type (if necessary)
 - ☐ Contains and uses one or more parameters that have an effect on the functionality of the procedure
 - ☐ Implements an algorithm that includes sequencing, selection, and iteration

- ii. The second program code segment must show where your student-developed procedure is being called in your program.

Then, provide a written response that does both of the following:

- iii. Describes in general what the identified procedure does and how it contributes to the overall functionality of the program

- iv. Explains in detailed steps how the algorithm implemented in the identified procedure works. Your explanation must be detailed enough for someone else to recreate it.

IMPORTANT:

Built-in or existing procedures and language structures, such as event handlers and main methods, are not considered student-developed.

3d. Provide a written response that does all three of the following:

Approx. 200 words (for all subparts of 3d combined)

- i. Describes two calls to the procedure identified in written response 3c. Each call must pass a different argument(s) that causes a different segment of code in the algorithm to execute.

First call:

Second call:

- ii. Describes what condition(s) is being tested by each call to the procedure

Condition(s) tested by the first call:

Condition(s) tested by the second call:

- iii. Identifies the result of each call

Result of the first call:

Result of the second call:
